

## Ratio of Surface Area to Volume in Cells

Cell Size			
Surface Area (length x width x 6)	$1\text{ cm} \times 1\text{ cm} \times 6 = 6\text{ cm}^2$	$2\text{ cm} \times 2\text{ cm} \times 6 = 24\text{ cm}^2$	$3\text{ cm} \times 3\text{ cm} \times 6 = 54\text{ cm}^2$
Volume (length x width x height)	$1\text{ cm} \times 1\text{ cm} \times 1\text{ cm} = 1\text{ cm}^3$	$2\text{ cm} \times 2\text{ cm} \times 2\text{ cm} = 8\text{ cm}^3$	$3\text{ cm} \times 3\text{ cm} \times 3\text{ cm} = 27\text{ cm}^3$
Ratio of Surface Area to Volume	$6 / 1 = 6 : 1$	$24 / 8 = 3 : 1$	$54 / 27 = 2 : 1$

As the length of a cell increases, its volume increases faster than its surface area.

This causes the ratio of surface area to volume to decrease, which causes serious problems for the cell.

Before a cell becomes too large, a growing cell divides forming two "daughter" cells,

This process is called cell division.

Before cell division occurs, the cell copies all of its DNA.

Duplication of DNA solves the problem of information sending & storage.

Division also solves the problem of size by increasing the surface area to volume ratio for efficient exchange of materials with the environment.
